#### **Euclidean Geometry**

Taking any two distinct points there exists one and only one straight line connecting them.

-∢ ≣ ≯

#### Euclidean Geometry

Taking any two distinct points there exists one and only one straight line connecting them.

non-Euclidean Geometry

A 1

#### Euclidean Geometry

Taking any two distinct points there exists one and only one straight line connecting them.

### non-Euclidean Geometry

Taking any two distinct points we can have either more than one "straight line" connecting them or no one at all.

#### Euclidean Geometry

Taking any two distinct points there exists one and only one straight line connecting them.

### non-Euclidean Geometry

Taking any two distinct points we can have either more than one "straight line" connecting them or no one at all.

Example  $(\mathcal{M}, g)$  semi–Riemannian manifold: "straight line"  $\approx$  geodesic

### Euclidean Geometry

Taking any two distinct points there exists one and only one straight line connecting them.

### non-Euclidean Geometry

Taking any two distinct points we can have either more than one "straight line" connecting them or no one at all.

Example  $(\mathcal{M}, g)$  semi–Riemannian manifold: "straight line"  $\approx$  geodesic

#### Problem

When may two fixed points be connected by a geodesic? When is  ${\cal M}$  geodesically connected?

## Geodesic connectedness in Riemannian manifolds

Riemannian manifold  $(\mathcal{M}_0, \langle \cdot, \cdot \rangle_R)$ 

回 と く ヨ と く ヨ と

# Geodesic connectedness in Riemannian manifolds

### Riemannian manifold $(\mathcal{M}_0, \langle \cdot, \cdot \rangle_R)$

### Theorem (Hopf–Rinow)

 $\mathcal{M}_0$  complete with respect to the distance associated to  $\langle \cdot, \cdot \rangle_R$  or, equivalently,  $\mathcal{M}_0$  geodesically complete  $\downarrow \downarrow$  $\mathcal{M}_0$  geodesically connected.

# Geodesic connectedness in Riemannian manifolds

## Riemannian manifold $(\mathcal{M}_0, \langle \cdot, \cdot \rangle_R)$

### Theorem (Hopf–Rinow)

 $\mathcal{M}_0$  complete with respect to the distance associated to  $\langle \cdot, \cdot \rangle_R$  or, equivalently,  $\mathcal{M}_0$  geodesically complete

 $\mathcal{M}_0$  geodesically connected.

Here, 
$$d(x_1, x_2) = \inf \left\{ \int_a^b \sqrt{\langle \gamma', \gamma' \rangle_R} ds : \gamma \in A_{x_1, x_2} \right\}$$
  
with  $x_1, x_2 \in \mathcal{M}_0$  and  $\gamma \in A_{x_1, x_2}$  if  $\gamma : [a, b] \to \mathcal{M}_0$  is a piecewise smooth curve joining  $x_1$  to  $x_2$ .

 $(\mathcal{M},g)$  semi–Riemannian manifold.

・ロン ・四 と ・ ヨ と ・ モン・

 $(\mathcal{M}, g)$  semi–Riemannian manifold. Fix  $p, q \in \mathcal{M}$ .

・ロト ・回ト ・ヨト ・ヨト

 $(\mathcal{M}, g)$  semi–Riemannian manifold. Fix  $p, q \in \mathcal{M}$ .

Classical variational principle  $\bar{z}: I \to \mathcal{M}$  is a geodesic joining p to q in  $\mathcal{M}$ 

 $ar{z} = ar{z}(s)$  is a critical point of the action functional  $f(z) = \int_0^1 g(z(s))[z'(s), z'(s)] \, ds$  in  $C^1(p, q)$ , with  $C^1(p, q) = \{z \in C^1([0, 1], \mathcal{M}) : z(0) = p, \ z(1) = q\}$ .

1

回 と く ヨ と く ヨ と

 $(\mathcal{M}, g)$  semi-Riemannian manifold. Fix  $p, q \in \mathcal{M}$ .

Classical variational principle  $\bar{z}: I \to \mathcal{M}$  is a geodesic joining p to q in  $\mathcal{M}$  $\hat{T}$ 

 $ar{z} = ar{z}(s)$  is a critical point of the action functional  $f(z) = \int_0^1 g(z(s))[z'(s), z'(s)] \, ds$  in  $C^1(p, q)$ , with  $C^1(p, q) = \{z \in C^1([0, 1], \mathcal{M}) : z(0) = p, \ z(1) = q\}$ .

#### Remark

Without loss of generality, we can take I = [0, 1] as the set of geodesics is invariant by affine reparametrizations.

Abstract tools: existence result

Let  $\Omega$  be a Riemannian manifold modelled on a Banach space and  $J \in C^1(\Omega, \mathbb{R})$ .

▲圖> ▲屋> ▲屋>

### Abstract tools: existence result

Let  $\Omega$  be a Riemannian manifold modelled on a Banach space and  $J \in C^1(\Omega, \mathbb{R})$ .

#### Definition

J satisfies the Palais–Smale condition on  $\Omega$ , briefly (*PS*), if any sequence  $(x_k)_k \subset \Omega$  such that

$$(J(x_k))_k$$
 is bounded and  $\lim_{k \to +\infty} J'(x_k) = 0$ 

has a subsequence converging in  $\Omega$ .

/⊒ > < ≣ >

### Abstract tools: existence result

Special cases:

- $\mathcal{M} \equiv \mathbb{R}$  is the 1-dimensional Euclidean space;
- $(\mathcal{M}, g) \equiv (\mathcal{M}_0, \langle \cdot, \cdot \rangle_R)$  is a (connected) finite dimensional Riemannian manifold.

Case  $\mathcal{M} \equiv \mathbb{R}$ Fixing any  $t_p$ ,  $t_q \in \mathbb{R}$ , it is  $W^1(t_p, t_q) = \{t \in H^1(I, \mathbb{R}) : t(0) = t_p, t(1) = t_q\} = H_0^1(I, \mathbb{R}) + j^*$ , with  $H_0^1(I, \mathbb{R}) = \{\tau \in H^1(I, \mathbb{R}) : \tau(0) = 0 = \tau(1)\},\ j^* : s \in I \mapsto t_p + s\Delta_t \in \mathbb{R}, \qquad \Delta_t = t_q - t_p.$ Whence,  $W^1(t_p, t_q)$  is a closed affine submanifold of  $H^1(I, \mathbb{R})$ with  $T_t W^1(t_p, t_q) \equiv H_0^1(I, \mathbb{R})$  for all  $t \in W^1(t_p, t_q).$ 

 $\mathsf{Case}\;(\mathcal{M},g)\equiv(\mathcal{M}_0,\langle\cdot,\cdot\rangle_R)$
## The action functional: functional framework

### $\mathsf{Case}\;(\mathcal{M},g)\equiv(\mathcal{M}_0,\langle\cdot,\cdot\rangle_R)$

By the Nash Embedding Theorem,  $\mathcal{M}_0$  (at least  $C^2$ ) is a submanifold of an Euclidean space  $\mathbb{R}^N$  (the embedding is closed in compact regions [Nash '63], complete regions [Müller '09]) and  $\langle \cdot, \cdot \rangle_R$  is the restriction to  $\mathcal{M}_0$  of the standard Euclidean metric of  $\mathbb{R}^N$ .

## The action functional: functional framework

 $\mathsf{Case}\;(\mathcal{M},g)\equiv(\mathcal{M}_0,\langle\cdot,\cdot\rangle_R)$ 

By the Nash Embedding Theorem,  $\mathcal{M}_0$  (at least  $C^2$ ) is a submanifold of an Euclidean space  $\mathbb{R}^N$  (the embedding is closed in compact regions [Nash '63], complete regions [Müller '09]) and  $\langle \cdot, \cdot \rangle_R$  is the restriction to  $\mathcal{M}_0$  of the standard Euclidean metric of  $\mathbb{R}^N$ .

Hence,

$$H^1(I,\mathcal{M}_0) \equiv \{ x \in H^1(I,\mathbb{R}^N) : x(I) \subset \mathcal{M}_0 \},\$$

and, fixing any  $x_p$ ,  $x_q \in \mathcal{M}_0$ , we have

 $\Omega^1(x_p, x_q; \mathcal{M}_0) = \{x : I \to \mathcal{M}_0 : x \text{ absolutely continuous,} \}$ 

$$x(0)=x_p, x(1)=x_q, \int_0^1 \langle x', x' \rangle_R ds < +\infty \}.$$

### Extrinsic approach, method (a)

 $\mathcal{M}=\mathcal{M}_0 imes\mathbb{R}$  standard stationary spacetime,  $p=(x_p,t_p),\;q=(x_q,t_q)$ 

### Proposition (New variational principle)

 $z^* = (x^*, t^*) \in \Omega^1(p, q; \mathcal{M})$  is a critical point of the action functional f in  $\Omega^1(p, q; \mathcal{M})$  if and only if  $x^*$  is a critical point of the functional  $\mathcal{J} : \Omega^1(x_p, x_q; \mathcal{M}_0) \to \mathbb{R}$  defined as

$$\begin{split} \mathcal{J}(x) &= \int_0^1 \langle x', x' \rangle_R \ ds \ + \ \int_0^1 \frac{\langle \delta(x), x' \rangle_R^2}{\beta(x)} \ ds \\ &- \left( \int_0^1 \frac{\langle \delta(x), x' \rangle_R}{\beta(x)} \ ds - \Delta_t \right)^2 \ \left( \int_0^1 \frac{1}{\beta(x)} \ ds \right)^{-1} \end{split}$$

and  $t^* = \Psi(x^*)$ , with  $\Delta_t^2 = (t_q - t_p)^2$ . Moreover,  $f(z^*) = \mathcal{J}(x^*)$ .

# Extrinsic approach, method (a)

In the previous proposition, it is  

$$\Psi: \Omega^{1}(x_{p}, x_{q}; \mathcal{M}_{0}) \to W^{1}(t_{p}, t_{q}) \text{ defined as}$$

$$\Psi(x)(s) = t_{0} + \int_{0}^{s} \frac{\langle \delta(x(\sigma)), \dot{x}(\sigma) \rangle}{\beta(x(\sigma))} d\sigma$$

$$- \left( \int_{0}^{1} \frac{\langle \delta(x), \dot{x} \rangle}{\beta(x)} ds - \Delta_{t} \right) \int_{0}^{s} \frac{1}{\beta(x(\sigma))} d\sigma \left( \int_{0}^{1} \frac{1}{\beta(x)} ds \right)^{-1}$$

$$\begin{array}{l} \text{Define } \Omega^1_{\mathcal{K}}(p,q) = \{z \in \Omega^1(p,q;\mathcal{M}) : \exists C_z \in \mathbb{R} \text{ such that} \\ \langle z', \mathcal{K}(z) \rangle_L = C_z \text{ a.e. on } I \}. \end{array}$$

#### Theorem

If  $z \in \Omega^1_K(p,q)$  is a critical point of f restricted to  $\Omega^1_K(p,q)$ , then z is a geodesic connecting p and q.

The following definition translates, essentially, classical Palais–Smale condition to the stationary ambient.

\_∢ ≣ ≯

The following definition translates, essentially, classical Palais–Smale condition to the stationary ambient.

### Definition

Fixed  $c \in \mathbb{R}$  the set  $\Omega_{K}^{1}(p,q)$  is *c*-precompact for *f* if every sequence  $(z_{n})_{n} \subset \Omega_{K}^{1}(p,q)$  with  $f(z_{n}) \leq c$  has a subsequence which converges weakly in  $\Omega^{1}(p,q;\mathcal{M})$  (hence, uniformly in  $\mathcal{M}$ ). Furthermore, the restriction of *f* to  $\Omega_{K}^{1}(p,q)$  is pseudo-coercive if  $\Omega_{K}^{1}(p,q)$  is *c*-precompact for all  $c \geq \inf f(\Omega_{K}^{1}(p,q))$ .

The "abstract" result is:

ヘロン ヘヨン ヘヨン ヘヨン

### The "abstract" result is:

#### Theorem

If  $\Omega^1_K(p,q)$  is not empty and there exists  $c > \inf f(\Omega^1_K(p,q))$  such that  $\Omega^1_K(p,q)$  is c-precompact, then there exists at least one geodesic joining p to q in  $\mathcal{M}$ 

• F. Giannoni and P. Piccione, Comm. Anal. Geom. 7 (1999)

### The "abstract" result is:

### Theorem

If  $\Omega^1_K(p,q)$  is not empty and there exists  $c > \inf f(\Omega^1_K(p,q))$  such that  $\Omega^1_K(p,q)$  is c-precompact, then there exists at least one geodesic joining p to q in  $\mathcal{M}$ 

• F. Giannoni and P. Piccione, Comm. Anal. Geom. 7 (1999)

### Remark

The main limitation of Giannoni and Piccione's results is that pseudo-coercivity condition is analytical and very technical. Furthermore, in general, the assumption  $\Omega^1_K(p,q)$  non-empty must be imposed.

イロト イヨト イヨト イヨト
### Intrinsic approach

In order to overcome the limitation of Giannoni and Piccione's result, the idea is to introduce purely geometric assumptions on  $\mathcal{M}.$ 

### Intrinsic approach

In order to overcome the limitation of Giannoni and Piccione's result, the idea is to introduce purely geometric assumptions on  $\mathcal{M}.$ 

#### Theorem

Let  $(\mathcal{M}, \langle \cdot, \cdot \rangle_L)$  be a stationary spacetime with a complete timelike Killing vector field K. If  $\mathcal{M}$  is globally hyperbolic with a complete (smooth, spacelike) Cauchy hypersurface S, then it is geodesically connected.

## Applications: Avez-Seifert result

An alternative proof of the classical Avez-Seifert result:

#### Proposition

Let  $(\mathcal{M}, \langle \cdot, \cdot \rangle_L)$  be a globally hyperbolic spacetime endowed with a complete lightlike Killing vector field K and a complete Cauchy hypersurface S. Then, two points of  $\mathcal{M}$  can be connected by a causal geodesic if and only if they are causally related.

#### Definition

A Lorentzian manifold  $(\mathcal{M}, \langle \cdot, \cdot \rangle_L)$  is called *generalized plane wave*, briefly *GPW*, if there exists a (connected) finite dimensional Riemannian manifold  $(\mathcal{M}_0, \langle \cdot, \cdot \rangle_R)$  such that  $\mathcal{M} = \mathcal{M}_0 \times \mathbb{R}^2$  and

$$\langle \cdot, \cdot \rangle_L = \langle \cdot, \cdot \rangle_R + 2 du dv + \mathcal{H}(x, u) du^2,$$

where  $x \in \mathcal{M}_0$ , the variables (u, v) are the natural coordinates of  $\mathbb{R}^2$  and the smooth function  $\mathcal{H} : \mathcal{M}_0 \times \mathbb{R} \to \mathbb{R}$  is not identically zero.

#### Definition

A Lorentzian manifold  $(\mathcal{M}, \langle \cdot, \cdot \rangle_L)$  is called *generalized plane wave*, briefly *GPW*, if there exists a (connected) finite dimensional Riemannian manifold  $(\mathcal{M}_0, \langle \cdot, \cdot \rangle_R)$  such that  $\mathcal{M} = \mathcal{M}_0 \times \mathbb{R}^2$  and

$$\langle \cdot, \cdot \rangle_L = \langle \cdot, \cdot \rangle_R + 2 du dv + \mathcal{H}(x, u) du^2,$$

where  $x \in \mathcal{M}_0$ , the variables (u, v) are the natural coordinates of  $\mathbb{R}^2$  and the smooth function  $\mathcal{H} : \mathcal{M}_0 \times \mathbb{R} \to \mathbb{R}$  is not identically zero.

A GPW becomes a gravitational wave if  $\mathcal{M}_0 = \mathbb{R}^2$  is equipped with the classical Euclidean metric and  $\mathcal{H}(x, u) = g_1(u)(x_1^2 - x_2^2) + 2g_2(u)x_1x_2, x = (x_1, x_2) \in \mathbb{R}^2$ , with  $g_1, g_2$  smooth real functions such that  $g_1^2 + g_2^2 \neq 0$ .

About geodesic connectedness and global hyperbolicity of GPWs:

白 ト く ヨ ト く ヨ ト

About geodesic connectedness and global hyperbolicity of GPWs:

#### Theorem

If the Riemannian manifold  $(\mathcal{M}_0, \langle \cdot, \cdot \rangle_R)$  is complete with respect to its canonical distance and  $\mathcal{H}$  behaves subquadratically at spatial infinity, i.e., there exist  $\bar{x} \in \mathcal{M}_0$  and (positive) continuous functions  $R_1(u)$ ,  $R_2(u)$ , p(u), with p(u) < 2, such that

 $-\mathcal{H}(x,u) \leq R_1(u)d^{p(u)}(x,ar{x}) + R_2(u) \quad \textit{for all } (x,u) \in \mathcal{M}_0 imes \mathbb{R},$ 

then the spacetime is geodesically connected and globally hyperbolic.
